DATA SHEET:

ONE PIPE MULTI-CONNECT

BETTER PERFORMANCE. LOWER COST.

CUSTOM DESIGNED NETWORK SOLUTION

Our One Pipe Multi-Connect solutions use one Carrier Ethernet enabled connection to deliver multiple, independent, dynamic and secure network streams of data.

Using secure separate streams ensures that each service has switching autonomy meaning that each stream can be connected independently.

One Pipe Multi-Connect allows your company to keep private data off the Internet, coupled with bullet-proof Internet service, all on one network pipe.

Internet traffic goes to our Premium Blended Internet service.

MegaLan and GigaLan traffic goes office-to-office on private connections, not over the Internet.

- Cloud Exchange connects directly to Cloud and Service Provider Platforms, not over the Internet.
- Private Data Center connections go from your offices directly to the Massive Data Centers, not over the Internet.
- By using the Massive One Pipe Multi-Connect Network solution, you get separate and private streams running within the Multi-Connect solution, providing superior performance and security, while getting you the most out of every network dollar.
